AMATERASU

BRIGHT PRE-AMP

The bright pre-amp is a jfet-fronted 20dB maximum signal gain pre-amplifier voiced by an extra treble boosting stage of 12dB with a frequency cutoff at around 3.2kHz. Best used to breathe more presence into sometimes duller humbucker pickups, it will absolutely turn single coils into incisive tone razors. Very responsive to your play style, the Amaterasu can be used to give life to quieter guitar pickups or to kick your favorite overdrive a notch or two further.
